a popular way to assess the effort needed to solve a problem is to count how many evaluations of the problem functions and their derivatives are required in many cases this is often the dominating computational cost given an optimization problem satisfying reasonable assumptions and given access to problem function values and derivatives of various degrees how many evaluations might be required to approximately solve the problem evaluation complexity of algorithms for nonconvex optimization theory computation and perspectives addresses this question for nonconvex optimization problems those that may have local minimizers and appear most often in practice this is the first book on complexity to cover topics such as composite and constrained optimization derivative free optimization subproblem solution and optimal lower and sharpness bounds for nonconvex problems it is also the first to address the disadvantages of traditional optimality measures and propose useful surrogates leading to algorithms that compute approximate high order critical points and to compare traditional and new methods highlighting the advantages of the latter from a complexity point of view this is the go to book for those interested in solving nonconvex optimization problems it is suitable for advanced undergraduate and graduate students in courses on advanced numerical analysis data science numerical optimization and approximation theory
